

Validation of Design Against Requirements

Team	87 - IBM Cyber Security - Quantum Risks
Project	Crack the channel - Interactive QKD Learning Platform
Task	Validate the restyled login page and team page mockups against the BA requirements, including required fields, login scope, acceptance criteria and identified edge cases.
Based on	Restyled Login Page & Team Page: Mockups, prepared by Jerome Altamia, 13 August 2026
Prepared by	Srilekha Byreddy
Date	13 August 2026
Status	Validated - Design requirements and identified edge cases validated; functional testing remains for implementation verification.

BA Validation of UX Design:

Requirement	Validation	Evidence	Result
Team name displayed	Team name is clearly shown at the top of the team page.	UX mockup shows "Team 87 - IBM Cyber Security - Quantum Risks".	Pass
Project name displayed	Project name is displayed directly below the team name.	UX traceability explicitly confirms this	Pass
Member photo	Every member has a photo where available; fallback is provided when unavailable.	Photos use a fixed circular frame; initials are used as fallback.	Pass

Member name	Names are displayed on each member card.	Traceability confirms names wrap normally to avoid layout problems.	Pass
Member role	Role is displayed for	Roles use the mono	Pass
	each member	uppercase label treatment	
Member blurb	Each member has a short description.	Mockup shows blurbs and provides Read more/Show less for longer content	Pass
Login visual styling	Login page has a consistent approved visual design.	Dark security-console theme, accent(violet) interactive elements and consistent styling.	Pass
Authentication unchanged	This cannot be proven from the visual mockup itself, but the UX document states existing authentication/validation/session behaviour was untouched.	UX documentation states existing handlers and validation were unchanged.	Documented

Edge Cases:

Edge cases	Requirements	UX Design	Result
EC1 - Missing photo	No broken/empty image area; UX decides treatment.	Use accent(violet) initials avatar.	Pass
EC2 - Long name/role	Must remain readable without breaking cards	Flexible columns and normal wrapping are specified.	Covered

EC3 - Long blurb	Must remain accessible without breaking layout.	Use Read more/Show less	Pass
EC4 - Different photo dimensions	Photos must remain consistent without distortion.	Fixed circular frame prevents distortion	Pass
EC5 - Small screens	Page must remain usable/readable on mobile/narrow screens.	Grid changes from 1 to 3 columns depending on screen size	Pass
EC6 - Invalid login	Existing validation remains unchanged; UX determines visual error treatment.	Existing red error states are retained/recoloured; validation logic unchanged.	Pass
EC7 - Direct access without authentication	Unauthenticated users must not access the team page and must be redirected to login.	/team is protected by a server-side session check. Unauthenticated requests are redirected to /auth/signin. The document states that a logged-out request to /team was directly verified to return a redirect rather than page content	Addressed separately / functional verification required

Project Title and Visual Consistency

Requirement: The project title and visual styling displayed in the UX mockups must be consistent with the agreed project direction and current design.

Validation Evidence: The updated login and team-page mockups now reflect the “Crack the Channel - Interactive QKD Learning Platform” project direction. The visual design has also been updated to use the approved violet accent consistently across interactive elements.

Result: Pass

Validation Notes:

- ✓ Project title updated consistently across the mockups
- ✓ Violet accent colour reflected in the current design
- ✓ Login and team-page mockups are visually consistent
- ✓ Updated mockups are ready for BA re-validation

.

Acceptance Criteria Validation:

AC1 - Successful login leads to team page

The requirement is successful login must direct the user to the team page. UX design document states that the sign-in redirect target points to team page

Result: Documented, but functional testing is still required.

AC2 - Invalid login / unauthenticated access

The requirement has two parts:

1. Invalid login must be handled correctly.
2. Unauthenticated users must not access the team page.

Invalid login handling is covered, with the existing validation behaviour and error treatment remaining unchanged. The updated implementation also confirms that unauthenticated users cannot directly access /team and are redirected to /auth/Signin.

Result: Pass - Both invalid login handling and unauthenticated direct access are addressed.

AC3 - Team page displayed correctly

The design clearly contains:

- Team name, Project name, Member information, Photos/fallbacks, Roles and Blurbs

The mockup also addresses the responsive layout.

Result: Pass for design.

Actual browser testing is still needed to prove there are no broken elements.

AC4 - Member information displayed

The design directly addresses:

- Photo, Name, Role, Blurb and the traceability table maps

each requirement to the team page.

Result: Pass

AC5 - Approved login styling

The login design follows the agreed visual styling, and the UX document states the existing functionality was not changed.

Result: Pass for design.
